

I'M AN ARCHAEOLOGICAL RESEARCHER, HOW CAN I USE DINAA OPEN DATA TO INVESTIGATE SITES AND DISTRIBUTIONS IMPORTANT TO MY WORK?

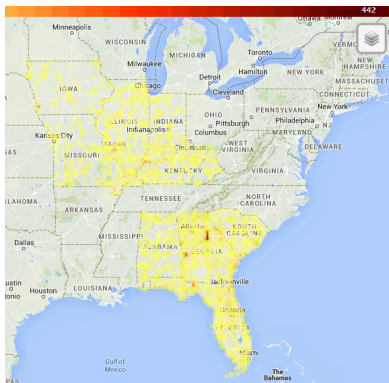

DINAA: The Digital Index of North American Archaeology
<http://ux.opencontext.org/archaeology-site-data>

DINAA is a **completely free, open source, open data** project to share and reuse non-sensitive* archaeological site data. DINAA users can access and employ community information in any number of ways, with attributes of time, space, and culture. DINAA data partners benefit from their data being citable and discoverable through DINAA's community resources, and can retain control over data they create. DINAA was established through funding from the National Science Foundation.

** e.g. anything but precise site locations, NAGPRA sensitive information, or other similarly protected data*

LOW: USE DINAA QUERIES TO SEARCH & BROWSE SITE DATA

Go to the DINAA website and click the link, “Explore a Draft Release of the Data” to use our query tools. This image shows a result of 17,750 sites returned by a query on the key phrase LATE PREHISTORIC. A user may click through these results, or refine them by site types, culture names, diagnostic artifacts, states, or many other data fields.

DINAA data are made possible by partners at state historic preservation offices (SHPOs) and researchers who are interested in making their own data visible and citable online by using DINAA's site identifier and archaeological concept ontologies. Ask us how you can join your data to the growing community network!

MEDIUM: NUANCED QUERIES & INFO FROM SHPOS + OTHERS

DINAA permits recognition of similar archaeological sites across state boundaries, and gives users the ability to access other information about these sites outside of the DINAA system.

- Each DINAA site entry contains reference and contact information to the appropriate state offices where qualified professionals can obtain further information.
- DINAA is building links to other database systems created by researchers, curators, and archivists, using Smithsonian Trinomials and Web links to help users find more information.
- DINAA maintains an online bibliography (also free and open) in Zotero that contains a growing list of references to authoritative culture history resources for each state, used to align definitions within the DINAA system - www.zotero.org/groups/dinaa_resources/items

HIGH: EXPORT 20KM GRID RESULTS OF DINAA QUERIES TO GIS

DINAA recommends the use of QGIS (www.qgis.org), a completely free and open-source GIS that matches the DINAA commitment to openness and lowering usage barriers (it is graphical, full-featured, and runs on any operating system with low memory demands).

NOTE: SEE THE RELATED DINAA PAMPHLET - DINAA GIS MADE EASY <http://goo.gl/LzHoVJ>

1. **Save your query:** at the bottom of each query page is a button, “Exports or Map Records.” Click it and save your *query* in an open standard format.
2. **Add to GIS:** add the GeoJson file to your preferred GIS software ...
 - a. QGIS - Use “Add Vector Layer” choose GeoJSON format, find your saved file and open.
 - b. ARCGIS - Start the “Data Interoperability” extension and add the file data as a layer.
3. **Analysis:** DINAA is free and open. Use it as you see fit. Please cite us when you publish it and link your data back to DINAA again to support the community network!

DINAA allows you to download, reuse, and share this handout.
